July 15, 2011

Mr. Terry L. O'Clair Director, Division of Air Quality North Dakota Department of Health Gold Seal Center 918 E. Divide, 2<sup>nd</sup> Floor Bismarck, ND 58501-1947

RE: BART Revisions and Proposed NOx Testing

Dear Mr. O'Clair:

In response to recent correspondence from EPA, Great River Energy (GRE) has reevaluated the Coal Creek Station (CCS) NOx technology options, as originally presented in the BART Emission Control Cost Analysis Table A-1a. After making minor corrections to some erroneous calculations and updates to the capital costs, the analysis shows that Selective Non-Catalytic Reduction (SNCR) technology is not cost effective.

In addition, Great River Energy is committing to additional NOx optimization studies to better improve upon emissions reductions. It is our firm position that SNCR should not be required, based upon cost effectiveness thresholds as well as the relatively minor deciview improvements associated with the emission controls. Finally, Great River Energy has strong reservations about the feasibility of the ash mitigation technology, which will negatively impact ash sales. Given the limited timeframe to respond to recent EPA correspondence, Great River Energy has not been able to fully investigate the ash mitigation feasibility. We have, however, contacted the developer of the technology, Headwaters Resources. Headwaters has not conducted any research on application of this technology to lignite. Its inadequate experience with commercial application and the lack of research on lignite means that Headwaters is unable to provide any guarantee that the process can be successfully applied to treat lignite ash. Therefore, Headwaters does not recommend application of this technology at CCS. Consequently, it has not been included in the revised analysis.

Mr. Terry O'Clair July 15, 2011 Page 2

#### Revised Cost and Emission Information

Great River Energy has updated the cost and emission information (see attachments). Most notably, Great River Energy has updated the SNCR capital cost based upon the recent revision to the IEC Cost model (Rev 3, Nov 2010). In the initial analysis, data from the 1998 cost model was used and was escalated to 2006 dollars. In order to remain consistent with other BART Analyses and other cost estimates, GRE has de-escalated the 2010 SNCR cost to 2006 dollars. With respect to emission information, Great River Energy noticed that the baseline NOx emission values did not use the highest two-year period from the baseline due to formatting error. This minor error was corrected.

#### Proposed NOx Optimization Study

Great River Energy recognizes the value of reducing emissions and supports NDDH's goal of lowering emissions, as demonstrated by our willingness to install emissions reduction technology (i.e., LNB3/SOFA "Option 2") well in advance of any regulatory requirement. In addition to these existing reductions, Great River Energy will commit to an evaluation and testing of NOx emissions to determine what emission reductions can now be achieved utilizing the novel DryFining<sup>TM</sup>, multi-pollutant control technology.

As you are well aware, Great River Energy voluntarily installed DryFining as an innovative patented technology. The development of the DryFining coal drying technology has taken over ten years. The system provides a means of beneficiating low-rank feedstock in a manner that results in more efficient power plant operation and reduced emissions. During its development, Great River Energy believed that the DryFining system would provide additional NOx reductions. However, with no operating experience, GRE could not predict with certainty NOx emissions reductions and could not include them as part of the Final BART Analysis, which was submitted to NDDH in late 2007. In December 2009, the \$285 million DryFining system was placed in service.

Throughout 2010 and 2011, Great River Energy has continued to modify and finalize the design of this new technology. DryFining design changes are now final. The NOx, SO<sub>2</sub> and mercury emissions have been lowered. As one example, Unit 2's 2011 year-to-date NOx emissions are 0.146 lbs/mmBtu. This represents a 28% reduction from pre-DryFining emissions. Note that CCS Unit 2 has also installed LNB/OFA Option 2 from the BART table, in advance of the BART requirements. CCS has already demonstrated it can achieve 30-day rolling average emissions below the presumptive BART limit of 0.17 lbs/mmBtu.

Mr. Terry O'Clair July 15, 2011 Page 3

Not only are Unit 2's year-to-date average emissions at 0.146 lbs/mmBtu, CCS has also operated at levels below 0.14 lbs/mmBtu on a short-term basis. CCS would need to conduct additional tuning and testing to determine whether this lower level is achievable on a 30-day rolling average basis.

To determine additional and achievable emissions reductions utilizing Option 2 and DryFining on Unit 2, Great River Energy proposes to complete a NOx optimization study. The scope of NOx optimization will include a comprehensive evaluation of NOx emissions and controls. The details of the testing program will be further determined as system experts and consultants are able to review and make recommendations for a testing protocol. The DryFining process is currently removing 8.5% of the feedstock moisture with a long term goal of 12% moisture removal. Great River Energy expects additional reductions as a result of the change in feedstock moisture. Additional testing is likely to include such things as boiler tuning and adjustments such as excessive air levels, an evaluation of computerized boiler optimization system benefits with DryFining, and burner, nozzle and SOFA designs associated with DryFining.

The preliminary timeline for testing is as follows:

- Develop testing protocol 2011
- Testing NOx emissions at 12% moisture removal 2011
- Engineering evaluation 2012
- Purchase, install and calibrate carbon monoxide monitor 2012
- Install additional thermocouples 2013
- Perform NOx testing 2012-2014
- Final report December 2014

Progress reports will be communicated to the NDDH and a final written report will be prepared and delivered no later than December 2014. Based on the results of this testing and evaluation, CCS will commit to an achievable NOx emission limit that is lower than the presumptive BART value of 0.17 lb/mmBtu that is currently in the NDDH State Implementation Plan (SIP).

In summary, Great River Energy has revised the cost and emission tables to demonstrate SNCR is not cost effective. If EPA moves forward by requiring SNCR, Great River Energy is very concerned about the technical feasibility of the ash mitigation technology and, in fact, the technology developer does not guarantee or recommend the application of this technology at CCS. Therefore, as another demonstration of our commitment to emission reductions and improvement to regional haze, Great River Energy offers to complete a NOx optimization study. If these NOx reductions are incorporated into the BART

Mr. Terry O'Clair July 15, 2011 Page 4

analysis, it would further demonstrate that SNCR is not cost effective. We would appreciate any questions or comments that you may have on the revised analysis and proposed NOx optimization study.

GRE believes this approach is appropriately within the NDDH's authority. We request that NDDH take action to remove CCS from a proposed FIP and include this approach in the North Dakota SIP.

Please contact me if you have any questions (763-445-5212).

Sincerely,

**GREAT RIVER ENERGY** 

Mary Jo Roth

Manager, Environmental Services

#### Notes & Assumptions

- Estimated Equipment Cost per EPA Air Pollution Control Cost Manual 6th Ed 2002, Section 4.2 Chapter 1
- Capital Cost per EPA Air Pollution Control Cost Manual 6th Ed 2002, Section 4.2 Chapter 1 Eq 1.19
- Reagent Use per EPA Air Pollution Control Cost Manual 6th Ed 2002, Section 4.2 Chapter 1 Eq 1.22
- Water use per EPA Air Pollution Control Cost Manual 6th Ed 2002, Section 4.2 Chapter 1 Eq 1.25
- 6 Additional Fuel Use per EPA Air Pollution Control Cost Manual 6th Ed 2002, Section 4.2 Chapter 1 Eq 1.29
- 7 SNCR Electrical Demand per EPA Air Pollution Control Cost Manual 6th Ed 2002, Section 4.2 Chapter 1 Eq 1.23
- 8 SNCR Maintenance Costs EPA Air Pollution Control Cost Manual 6th Ed 2002, Section 4.2 Chapter 1 Eq 1.21
- 9 Lignite Coal Assumptions 6,054 Btu/lb (wet) Ash 6.2% 42% moisture \$10.20/ton delivered
- 10 Control Efficiency = % reduction needed to meet presumptive BART of 0.29 lb/MMBtu
- Presumptive BART limits use as basis for emission reductions in NOx control cost analysis (e.g. NOX limit for lignite is 0.29lb NOx /MMBTU) Using emission reduction feasible in recent BACT determinations (70% or higher) can significantly reduce the \$/ton control cost down to values
- 11 approaching the BART economic feasibility values for presumptive BART.
- 12 Process, emissions and cost data listed above is for one unit.
  - For units of measure, k = 1,000 units, MM = 1,000,000 units e.g. kgal = 1,000 gal
- 13 Values obtained from IECCOST Model V.3, Issued November 5, 2010. (\$25.47/kW at 550,000kW)

Nitrous Oxides (NOx)	1,294.2	5,572.4	32%			3799.3	1,773.0	350
Sulfur Dioxide (SO <sub>2</sub> )	4,025.8	17,334.1				17334.1	-	NA

- Notes & Assumptions
  1 Sept 2005 Cost Estimate from Foster Wheeler, Option 1. Assumed price listed is for one unit. Costs in spreadsheet are for one unit
  2 Calculations per EPA Air Pollution Control Cost Manual 6th Ed 2002, Section 6 Chapter 2 (Used PM Scrubber which has lowest installed cost multiplier)
  3 Assumed 0.1 hr/shift operation and maintenance labor for LNB
- 4 Presumptive BART limits use as basis for emission reductions in NOx control cost analysis (e.g. NOX limit for lignite is 0.29lb NOx /MMBTU) Using emission reduction feasible in recent BACT determinations (70% or higher) can significantly reduce the \$/ton control cost down to values approaching the BART economic feasibility values for presumptive BART.
- 5 Process, emissions and cost data listed above is for one unit.
- 6 For units of measure, k = 1,000 units, MM = 1,000,000 units e.g. kgal = 1,000 gal

Sulfur Dioxide (SO <sub>2</sub> )	4,025.8	17,334.1				17334.1	-	NA

#### Notes & Assumptions

- 1 Sept 2005 Cost Estimate from Foster Wheeler, Option 1. Assumed price listed is for one unit. Costs in spreadsheet are for one unit
- Calculations per EPA Air Pollution Control Cost Manual 6th Ed 2002, Section 6 Chapter 2 (Used PM Scrubber which has lowest installed cost multiplier)
- 3 Assumed 0.1 hr/shift operatior and maintenance labor for LNB
- 4 Presumptive BART limits use as basis for emission reductions in NOx control cost analysis (e.g. NOX limit for lignite is 0.29lb NOx /MMBTU) Using emission reduction feasible in recent BACT determinations (70% or higher) can significantly reduce the \$/ton control cost down to values approaching the BART economic feasibility values for presumptive BART.
- 5 Process, emissions and cost data listed above is for one unit.
- 6 For units of measure, k = 1,000 units, MM = 1,000,000 units e.g. kgal = 1,000 gal
